

Auditor Quick-Reference Guide

Everything you need for your review — no prior experience required

Clarity · a Vaala product

Confidential — for authorized auditors only

Welcome — start here

Thanks for helping us put Clarity through its paces. This guide is written for someone who has never used this tool (or any CRM) before, so nothing here assumes prior knowledge. Read it once, keep it open in a tab, and you'll have what you need.

Your job in one sentence: click around the product like a curious new customer would, and tell us anytime something feels broken, confusing, or wrong.

GOOD TO KNOW

Everything you'll see is **dummy data** — made-up people, fake jobs, sample calls. Nothing you click can harm a real customer, send a real text, or charge anyone. You can explore freely and click boldly.

Your access expires automatically

Your auditor login is temporary. It switches off on its own three days after you first sign in, so there's nothing for you to cancel or clean up when you're done. If you need more time, just ask us to re-invite you.

What Clarity actually is

Clarity is two things working together:

1. **An AI phone receptionist.** When a customer calls a small business, an AI voice answers the phone, has a natural conversation, figures out who's calling and why, and writes it all down — 24/7, without a human picking up.
2. **A simple CRM.** Every one of those calls turns into a tidy record the business can act on: a contact, the reason they called, the full transcript, and the jobs that follow. The CRM is where the business manages all of it.

Think of it as a tireless front-desk employee who never misses a call, plus the filing cabinet and notebook that employee keeps. **It's intentionally simpler than giants like Salesforce or HubSpot** — that simplicity is the point. It's built for small businesses (think an HVAC or plumbing company) who want something they can actually understand.

Where the magic comes from (plain version)

Three outside services do the heavy lifting behind the scenes. You don't need to manage them — this is just so the words look familiar if you see them:

Service	What it does for Clarity
Twilio	Handles the actual phone line — connecting calls and turning speech into text.
OpenAI	The “brain” — understands the caller and decides what to say back.
ElevenLabs	The voice — makes the receptionist sound like a real, warm person.

NOTE

The silky smooth ElevenLabs voice only persists on the

Service	What it does for Clarity
"Premium Toggle" (switch on the Master Hub portal).	

How auditors fit in: the two levels

Clarity serves many businesses at once. There are two levels to keep straight, and as an auditor you can see both:

Level	What it is	Plain analogy
The Master Hub	The top-level control room. Lists every client business (each one is called a "portal"). You open a portal from here.	The landlord's master key ring
A Portal	One individual business's own workspace — its calls, contacts, jobs, and settings. This is what a real customer logs into.	A single tenant's apartment

To inspect a business, you open its portal from the Master Hub (look for an **"Open portal →"** button on each portal card). When you're done, you exit back out to the Hub. Most of your testing happens *inside* a portal, since that's where customers spend their time.

The Master Hub itself has three areas: **Portals** (the businesses), **Users** (the operator team), and **Feedback** — which is where you'll file everything you find (covered at the end).

AUDITOR TIP

You have wide reach by design — identical to what a Super Admin sees. The main thing you **can't** do is mark feedback tickets as resolved (that's reserved for the owner). You can still raise as many tickets as you like — that's exactly what we want.

Finding your way around a portal

Once you're inside a portal, the screen always has the same three parts. Learn these once and you'll never feel lost:

- **Left sidebar** — the main menu. Home Dashboard, Calls, Contacts, Jobs, Fields, Reports, Automations, Learning Center, and Feedback. Your Recycle Bin and Sign-out are at the bottom.
- **Top bar** — shows where you are, with a Refresh button, Impersonate As... and settings gear on the right.
- **Main area** — the page you're currently on. This is where you'll do most of your clicking.

The three-part layout: left sidebar (menu), top bar (Refresh + gear), and the main area — here showing the Calls page.

TIP

There's a built-in **Learning Center** in the left menu with step-by-step guides for every feature. If you're ever unsure how something is meant to work, check there. If it doesn't behave that way, you've found a bug worth reporting.

A quick tour of each section

You don't need to memorize this. Skim it, then refer back as you go. If you don't know something, you can always ask Bryson. :) Each section lists what it's for and the handful of things worth trying.

Home Dashboard

What it's for: Your “today at a glance” screen with simple counts and recent activity.

Worth trying: Click a count card and confirm it jumps to the right section. Click a recent call or contact and confirm it opens.

Calls

What it's for: Every call the AI receptionist has handled, newest first. Click a call to read the full conversation transcript. Below the list is the “AI Instructions” box (what the business teaches its receptionist) and a voice picker.

Worth trying: Open a few calls and read the transcripts. Edit the AI Instructions and Save. Try the Simulate call button (see Testing Toolkit).

REASON FOR CALLING

Water heater leaking from the bottom

RECEIVED

Today, 12:49 PM

NOTIFIED

Today, 12:52 PM

TRANSCRIPT

RECEPTIONIST

Thank you for calling Summit Home Services, this is the front desk. How can I help you today?

CALLER

There's water all around my water heater in the garage. It looks like it's leaking from the bottom.

RECEPTIONIST

Okay, let's get that taken care of before it gets worse. If you can safely reach the shutoff valve on the cold-water line above the heater, turning it clockwise will stop the flow. Are you able to do that?

CALLER

Yeah, I think I just turned it off.

RECEPTIONIST

Great, that'll help a lot. I'll get a technician scheduled. May I have your name?

A single call's detail panel — caller info plus the full word-for-word transcript.

Contacts

What it's for: The list of everyone who has reached the business. Click anyone to see their profile, timeline, and history.

Worth trying: Open a profile and edit a field, then Save. **Try Search, Filters, sorting by a column, and Manage columns.**

Recycle Bin

Johnathan Flores Portal Admin Sign out

The Jobs table — note the Type and Status columns and the “Create Dummy Job” button.

Fields

What it's for: Where custom fields are created — the extra bits of info a business wants to track. (Usually an admin task.)

Worth trying: Add a simple text field, confirm it appears on a contact, then delete it.

Reports

What it's for: Build dashboards and charts from the data — counts, bar charts, pie charts, trends over time.

Worth trying: Add a widget, drag it to reorder, and resize it. Confirm the numbers look sensible against what you saw elsewhere.

A Reports dashboard built from widgets: a KPI number, line and bar charts, and a pie chart.

Automations

What it's for: The “if this, then that” engine. Every automation is a Trigger (what happens) → Conditions (optional filters) → Actions (what to do).

Worth trying: Open one and read it. Use its Test button to dry-run it safely. Try “Start from a template” and “Build with a wizard.”

The Automations list — each card has an on/off switch plus Edit, Test, and Logs buttons.

Recycle Bin

What it's for: A safety net. Deleted contacts go here for 30 days before being removed for good — so deletes can be undone.

Worth trying: Delete a dummy contact, find it in the Recycle Bin, and Restore it. Confirm the day-countdown shows.

Feedback

What it's for: Where you'll report what you find. Note: each business portal has its own Feedback, but **as an auditor you'll use the Master Hub's Feedback instead (details below).**

Worth trying: See “How to report” — your reporting home base is on the Master Hub, not inside a single portal.

Settings (behind the gear icon | upper-right hand corner)

A few settings pages are worth a look. They're mostly self-explanatory:

- **General** — the business's name, hours, and the email where call summaries go.
- **Team** — invite teammates and set their role (Portal Admin or Client User).
- **Appearance / White-label** — pick a theme or design your own, and upload a logo to rebrand the portal. Worth testing that a saved theme actually sticks after a refresh. **Frutiger Aero is the coolest theme!**
- **Labels** — rename words the app uses (e.g. “Contacts” → “Clients”) and tidy the menu.
- **Lead capture** — secure links that let website forms drop new leads straight into the portal.

Settings → Appearance: pick or design a theme, and upload a logo to white-label the portal.

Your testing toolkit

Clarity gives you a few built-in tools to create test data and try features without needing a real phone or real customers. These are your best friends:

Tool	Where	What it does
Simulate call	Calls page (top)	Runs a complete fake phone call from start to finish, creating a new call + contact. The fastest way to see the whole system work.
Create Dummy contact	Contacts page	Instantly adds a realistic fake contact so you have something to click on.
Create Dummy Job	Jobs page	Instantly adds a fake job to test the jobs and pipeline features.
Test (on an automation)	Automations page	Safely dry-runs one automation against a contact and shows you what each step would do — without really doing it.
Refresh	Top bar	Reloads the current data. Handy to confirm a change really saved.

NOTE: Right now, I have one Twilio number to use for testing. It is 833-366-4447. It is active on the “Acme Services” portal. The idea is that each client / portal is assigned their own after-hours number where an ai receptionist will pick up when they cannot answer. The OpenAi + Twilio webhooks cost me cents per call, so please feel free to test the premium voice (less latency, can choose between voices) or standard (walkie talkie, latency) as much as you'd like. I debugged quite a bit, so this feature out of all of them ought to work.

How to test for bugs (the easy method)

You don't need a formal test plan or technical skills. The best auditors just use the product like a real person and stay alert. Here's a simple loop that works for any screen:

1. Pick one screen (say, Contacts) and create some dummy data to work with.
2. Do the obvious things a real user would do — open, edit, save, search, filter, delete, restore.
3. After each action, ask: “Did what I expected actually happen?” Refresh to be sure it saved.
4. When something surprises you — anything at all — feel free to note it in master hub > feedback.
5. Move to the next screen and repeat.

Two quick rules of thumb

TRY THE “UNHAPPY PATH” TOO

Bugs love edge cases. Leave a required box empty and hit Save. Put text where a number belongs. Click a button twice fast. Delete something and immediately restore it. Then refresh and reopen — did everything survive correctly?

TRUST YOUR CONFUSION

If something confused **you** — a new user — it will confuse a real customer. “This label was unclear” or “I couldn’t find X” is genuinely useful feedback, not just “things that crash.”

What counts as worth reporting

If you see any of these, write it down:

- An error message, a blank screen, or a page that won’t load.
- A change that doesn’t save, or that disappears after you refresh.
- A number or count that doesn’t match what you can see with your own eyes.
- A button or link that does nothing, or does the wrong thing.
- Layout that looks broken, overlapping, or cut off.
- Wording that’s confusing, misspelled, or inconsistent.
- Anything that just feels off, even if you can’t say exactly why.

REMINDER

Texts and emails not actually arriving is **expected** in this test environment — no need to report it. When in doubt, report it anyway; a false alarm costs us nothing.

How to report what you find

Report everything through the **Feedback** view on the **Master Hub** — the top level, alongside Portals and Users. The whole review team (auditors, super-admins, and the owner) can see and reply to every ticket there, so it’s the one shared place where your findings won’t get lost.

USE THE MASTER HUB FEEDBACK — NOT A PORTAL’S

Each individual business portal has its *own* Feedback section meant for that business’s staff. As an auditor, skip those and exit back out to the Master Hub, then open **Feedback** there. Tip: you can’t reach the Master Hub while you’re “inside” a portal, so exit the portal first.

A good report has just three parts

1. **What you did** — the steps to get there. (“On Contacts, I opened Marcus Bell, changed his phone, clicked Save.”)
2. **What you expected** — (“The new phone number should be saved.”)
3. **What actually happened** — (“After refreshing, it showed the old number again.”)

MAKE IT EASY TO REPRODUCE

If you can, note which portal you were in and roughly when it happened. A screenshot is gold. The easier we can repeat your steps, the faster we can fix it.

Mini-glossary

Term	In plain English
CRM	The system that stores customers and the work you do for them. Clarity is one.

Term	In plain English
Portal	One business's private workspace inside Clarity.
Contact	A person who reached out to the business.
Job	A piece of work for a contact — a quote, a repair, a visit.
Pipeline / Stage	The steps a job moves through, like New → Scheduled → Done.
Field	One piece of info on a record (e.g. phone, email, or a custom one).
Automation	A rule that does something for you automatically when a trigger happens.
Trigger	The event that starts an automation (e.g. "a new contact is added").
Transcript	The written word-for-word record of a phone conversation.
Soft delete	Deleting that's reversible — the item waits in the Recycle Bin for 30 days.
White-label	Rebranding the portal with a business's own logo and colors.

That's everything. Explore with confidence, click boldly, and tell us what you find — thank you for helping make Clarity better.
