1 · Welcome — start here

Thanks for helping put Clarity through its paces. This guide is written for someone who has never used this tool — or any CRM — before, so nothing here assumes prior knowledge. Read it once, keep it open in a tab, and you'll have what you need.

Your job in one sentence: **click around the product like a curious new customer would, and tell us anytime something feels broken, confusing, or wrong.**

GOOD TO KNOW

Everything you'll see is dummy data — made-up people, fake reservations, sample calls, addresses ending in @example.invalid, 555 phone numbers. Nothing you click can harm a real customer, send anything to a real person, or charge anyone. Explore freely and click boldly.

Your access expires automatically. Your auditor login is temporary — it switches off on its own three days after your account is created, so there's nothing for you to cancel or clean up when you're done. If you need more time, just ask to be re-invited.

TIP

You can reopen this guide anytime — there's a **Quick-Reference Guide** link at the bottom of the left sidebar on every screen.

2 · What Clarity actually is

Clarity is two things working together:

- **An AI phone receptionist.** When a customer calls a small business, an AI voice answers, has a natural conversation, figures out who's calling and why, and writes it all down — 24/7, without a human picking up.
- **A simple CRM.** Every one of those calls becomes a tidy record the business can act on: a contact, the reason they called, the full transcript, and the work that follows.

Think of it as a tireless front-desk employee who never misses a call, plus the filing cabinet that employee keeps. It's intentionally simpler than giants like Salesforce — that simplicity is the point. It's built for small businesses (a restaurant, an HVAC company, a recruiter) who want something they can actually understand.

Three outside services do the heavy lifting behind the scenes. You don't need to manage them — this is just so the words look familiar if you see them:

Service	What it does for Clarity
Twilio	Handles the actual phone line — connecting calls and turning speech into text.

Service	What it does for Clarity
OpenAI	The “brain” — understands the caller and decides what to say back.
ElevenLabs	The voice — makes the receptionist sound like a real, warm person.

3 · Signing in

Your invite email has a button to set your password. After that it's the normal drill: email and password, then a six-digit code from your authenticator app. Tick “Remember this device for 30 days” and it won't ask for the code again on that computer.

The sign-in screen, and the two-step code — a recovery code works if you don't have your phone.

4 · The two levels: the Master Hub and tenant portals

Clarity serves many businesses at once. There are two levels to keep straight, and as an auditor you can see both:

Level	What it is	Plain analogy
The Master Hub	The top-level control room. Lists every client business — each one is called a “tenant.” You open a tenant’s portal from here.	The landlord’s master key ring
A tenant portal	One business’s own workspace — its calls, contacts, reservations, and settings. This is what a real customer logs into.	A single tenant’s apartment

To inspect a business, open its portal from the Tenants list — the small ■ **arrow** on its row. When you're done, use ← **All tenants** at the bottom of the left sidebar to exit back out. Most of your testing

happens inside a portal, since that's where customers spend their time.

TENANT NAME	STATUS	CREATED	AI RECEPTIONIST	CALLS	CONTACTS	USERS	TENANT ACTIONS
Food Service Example Tenant Demo	Active	Jan 15, 5:18 PM	Premium voice	20	40	3	[Icon] [Icon] [Icon]
General (All Modules) Example Tenant Demo	Active	Jan 15, 5:17 PM	Premium voice	20	63	3	[Icon] [Icon] [Icon]
Field Services Example Tenant Demo	Active	Jan 15, 5:17 PM	Premium voice	20	61	3	[Icon] [Icon] [Icon]
Recruitment Marketing Example Tenant Demo	Active	Jan 15, 5:15 PM	Premium voice	15	79	3	[Icon] [Icon] [Icon]
AI Receptionist Only Example Tenant Demo	Active	Jan 15, 5:12 PM	Premium voice	20	64	3	[Icon] [Icon] [Icon]

The Master Hub's Tenants list — the arrow on each row opens that business's portal.

AUDITOR TIP

Your reach is wide by design — nearly identical to what a Super Admin sees. The main thing you can't do is mark Feedback tickets as resolved (the owner keeps that). You can still raise as many tickets as you like — that's exactly what we want.

5 · A tour of the Master Hub

Tenants

Every business, with live counts of calls, contacts, and users, plus a per-tenant voice picker. Click a row to open that tenant's control panel: which pages and modules it has (checked = on; unchecking hides that part for everyone in the tenant), and its user list.

Worth trying: toggle a module off on a demo tenant, open the portal and confirm it's gone, then switch it back on.

Tenants

← Back to tenants **Food Service Example Tenant** Active Demo

Configure this tenant's page access, users, and status — or open the tenant portal itself.

Modules and pages

Pages

Checked = the page is on and available for this tenant. Uncheck a page to LOCK it — a locked page is hidden from everyone in the tenant, including its Portal Admin, and can't be reached by direct link or API until an admin unlocks it here. (Record-type sections are managed as Modules, chosen when the tenant is created and toggled under Settings → Modules & Fields.)

- ☒ **Home Dashboard** The landing page — widgets, quick numbers, and shortcuts.
- ☒ **Calls** Every AI-answered call: transcript, caller, what was captured.
- ☒ **Analytics** Reports and charts over the tenant's own records.
- ☒ **Automations** If this then that flows the tenant builds (plus a library).
- ☒ **Communication** Email and text campaigns to customer lists.

Save page access

Modules

Checked = the module is on for this tenant and appears in its portal. Uncheck a module to switch it OFF — it disappears from Settings → Modules & Fields for everyone in the tenant, including its Portal Admin, though nothing is deleted and switching it back on restores it exactly. (A module's fields, layout and stages are managed inside the portal, not here.)

- ☒ **Contacts** Everyone the business talks to — callers land here automatically. Allegies Name Dietary notes +4 more
- ☒ **Job Openings** A recruiting pipeline (Applied → Hired) for hiring workflows.
- ☒ **Reservations** Simple appointments the AI receptionist can book callers into. Party size Seating preference Occasion
- ☒ **Equipment** Units and machines you service, each with its own history. Type Brand Model +7 more
- ☒ **Invoices** Bills with line items, totals, and paid tracking. Invoice number Status +7 more
- ☒ **Vehicles** A fleet list — vehicles with make, year, and color. Make Model Year VIN +6 more
- ☒ **Properties** Locations and sites you work at, one record each. Property address Property type +6 more

Save module access

Users + Create user

NAME	EMAIL	ROLE	LAST LOGIN	
Priya Raman	priya.raman.6sgh09@example.invalid	Client User	Never	Remove
Marcus Feld	sarcus.feld.6sgh09@example.invalid	Client User	Never	Remove
Dana Whitfield	dana.whitfield.6sgh09@example.invalid	Portal Admin	Never	Remove

A tenant's control panel — page and module toggles on top, its users below.

Users

The operator team and every portal's people in one list. **Worth trying:** find your own account and confirm it's listed as Auditor.

Billing & Usage

Dashboards of calls, minutes, tokens, and estimated cost, with date ranges and widgets you can add and rearrange. It runs in Stripe TEST mode — nothing real is ever charged. **Worth trying:** change the date range and confirm the numbers move sensibly.

Feedback

Your reporting home base — covered properly at the end of this guide.

Developer Tools

Three tabs. **History** is the product’s own diary — every change shipped (the Change Log), the audit log, and email history. **System Health** shows a status dot for every service Clarity depends on; worth a glance if something seems down, and Re-check all is safe to press. **Tools** → **Demo Data** fills a demo tenant with obviously-fake data so every screen has something on it.

Worth trying: Wipe a demo tenant, re-Seed it, then open its portal and see the fresh data.

DATE	TYPE	DESCRIPTION
Aug 2, 2026	Improvement	Two things. First, full screen actually does what it sounds like now. Pressing the menu button used to hide the side menu but leave the bar across the top, and the page simply sat in a wider column at the same size, which is not really full screen at all. Both bars go now, and the page grows into the space they were using. Same amount on screen, just bigger, the way zooming in works. How much bigger depends on your screen, which is deliberate. A setting that looks right on a large monitor is too much on a laptop, so the app works it out from how much room it just freed up. In practice it is between fifteen and twenty five percent larger, more on a smaller screen because the side menu was taking up a bigger share of it. On a phone or a narrow window, where the side menu is already tucked away, nothing is freed so nothing grows and you just get the bars out of the way. There are three ways back out. Press Escape, click the menu button which stays in the top left corner, or follow the note that appears for a few seconds when you go in and then fades so it is not sitting on top of your work. Everything comes back exactly as it was. Second, the coloured circles showing who is currently in a portal. Staff now appear too, as a rounded square rather than a circle, so you can tell at a glance who is a customer and who is one of us. The important part, and it is worth being clear about it: people inside a tenant cannot see staff at all. That is not a matter of hiding them on screen, which would be no privacy at all. Their computer is never sent the information in the first place. Only other staff can see staff. Hovering a square explains exactly that. One thing to expect: there is currently one person on the hub, so until there is a second staff member you will see a single square, which is yourself, and nothing else. That is the feature working, not a fault.
Jul 31, 2026	Improvement	The Create a Template screen has been reworked, mostly so that the modules part of it works the same way as Settings and then Modules and Fields does inside a tenant. Clicking one of the template buttons along the top now does something. It loads that template complete, every page, every module, every field, every setting, as your starting point. If it is a template you built, you are editing it and saving updates it. If it is one of the five that come with the product, you are starting a new one based on it, because those live in the code and cannot be changed from a screen. The form says which of the two you are doing at the top, before you can save anything, so there are no surprises. The top of the form is now three columns of similar width rather than two very wide boxes: name, description, and icon. The icon is a button showing your current choice. Click it and every icon appears at once so you can see them all together, with no captions cluttering it up. Pick one and it closes. Click again to change it or set it back to plan. It works from the keyboard and closes with Escape. The modules part now runs the full width of the page and behaves like the tenant screen: it is meant to mirror. Click a module and everything about that module appears underneath it, including the fields it comes with. That last part was the real problem: modules used to look identical apart from their names, because the fields they actually ship with were not shown at all. Now they are, marked as coming with the module, and anything you add sits below them. The three dots menu on a module now offers rename, move up, move down, and delete. Delete means leave this module out of the template, so a tenant made from it simply will not have it. The module stays on screen with a line through it rather than vanishing, so you can see what you have left out and put it back from the same menu. Hide is gone, since there was nobody to hide a module from. Three things were removed for being more clutter than help: the automation library picker, and the two sections for setting up home dashboard panels and report pages. If you already saved a template using any of those, it keeps them and still creates them, exactly as before. Only the controls went. The AI receptionist setting has moved to the bottom, and a help link that led nowhere has been fixed. It turned out that the Learning Center can only be opened from inside a tenant, so those links were quietly going to the wrong place when clicked from this screen. A help tip with nowhere to send you now simply has no link.
Jul 31, 2026	Fix	Settings and then Modules and Fields would not open inside a tenant portal. The page stayed blank instead of showing the modules and their fields. This was our fault and it was introduced by us in a recent change. When the Structure and behavior part of that screen was made reusable so the template builder could show the same controls, it was moved out to be shared but one of the pieces it depends on was left behind in the old place. From its new home it could no longer see that piece, so the moment the screen tried to draw it, it stopped and the rest of the page never appeared. Anything that opened that screen was affected, which is why it looked completely dead rather than partly broken. The screen is back to normal and nothing about it has changed otherwise. The modules, the fields, the drag and drop, the close and the main controls are all exactly as they were. Two things came out of this that we worth mentioning. Our main charts did not catch it, and the reason is unfortunate. The charts that use

Developer Tools → History — the Change Log, a plain-English diary of every update.

Developer Tools → System Health — one dot per service Clarity depends on.

Developer Tools → Tools → Demo Data — Seed and Wipe fake data per demo tenant.

6 · Inside a tenant portal: finding your way

Every portal has the same shape. Learn it once and you'll never feel lost:

- **Left sidebar = the business's MODULES** — the kinds of records it keeps. A restaurant has Reservations, Invoices, and a Menu; a recruiter has Job Openings. Modules are renameable and vary per business, so what you see may not match a teammate's screen — that's a feature, not a bug.

- **Top row = the PAGES** — fixed tools that work with that data: Home Dashboard, Calls, Analytics, Automations, Communication, Learning Center, and Feedback. Their names don't change.
- **Top right** — Search (finds anything), the bell (what Clarity noticed), small colored squares showing which staff are online right now (customers never appear there — their computers never send that information at all), your avatar, and the gear for Settings.

A portal's Home Dashboard — modules down the left, pages across the top.

TIP

The Learning Center page has step-by-step guides for every feature. If you're ever unsure how something is meant to work, check there — and if the product doesn't behave the way the guide says, you've found a bug worth reporting.

The Learning Center — built-in guides, searchable, organized by topic.

7 · A quick tour of each page

You don't need to memorize this. Skim it, then refer back as you go.

Home Dashboard

The “today at a glance” screen, built from widgets. **Worth trying:** + Add widget, try “Build with a wizard,” drag a card to reorder, resize one.

Calls

Every call the AI receptionist has handled, newest first — click one to read the full word-for-word transcript. **Worth trying:** read a few transcripts, then press **Simulate call** and watch a complete fake call appear. It's the fastest way to see the whole system work end to end.

The screenshot shows the Clarity interface. On the left is a sidebar with navigation links: Contacts, Reservations, Invoices, Menu, Catering quotes, and Prep tasks. Below this is a section for tenant management, showing 'Food Service Example Tenant' and 'A Vaala product' with a user 'Bryson Hall' (Owner) and buttons for 'Sign out' and 'Impersonate as...'. The top navigation bar includes links for Home Dashboard, Calls (active), Analytics, Automations, Communication, Learning Center, and Feedback, along with a search bar and user profile. The main content area is titled 'Calls' and features a table of call records. Above the table are buttons for 'Export', 'Simulate call', and a search bar. The table has columns: CALLER, PHONE, CALLER ID, REASON, STATUS, WHEN, EMAIL, TURNS, FINALIZED, and CALL ID. The data shows six completed calls from Sarah Chen, Aisha, Sam Carter, Maria Gonzalez, Helen Diaz, and Helen Park. At the bottom of the table, it says 'Showing 1-6 of 20' and has pagination controls for 'Prev', 'Page 1 of 4', and 'Next'.

CALLER	PHONE	CALLER ID	REASON	STATUS	WHEN	EMAIL	TURNS	FINALIZED	CALL ID
Sarah Chen	9195558888	+19195553111	—	Completed	Today, 6:15 PM	—	5	Today, 6:15 PM	SIM-1785795325201-5287
Aisha	+19195554692	+19195554692	—	Completed	Jul 22, 6:14 PM	aisha.b@example.com	4	Today, 6:14 PM	SIM-1785795236773-1234
Sam Carter	+19195556712	+19195556712	—	Completed	Jul 21, 6:12 PM	—	5	Today, 6:12 PM	SIM-1785795114534-8704
Maria Gonzalez	9195557732	+19195556354	—	Completed	Jul 19, 6:17 PM	—	3	Today, 6:17 PM	SIM-1785795459409-4211
Helen Diaz	9195552218	+19195552859	garage door repair	Completed	Jul 18, 6:16 PM	—	4	Today, 6:16 PM	SIM-1785795346298-2633
Helen Park	9195559998	+19195557281	—	Completed	Jul 16, 6:18 PM	—	4	Today, 6:18 PM	SIM-1785795468502-7196

The Calls page — every answered call, with Simulate call at the top right of the table.

Analytics

Dashboards and charts built from the business's own records. **Worth trying:** add a widget and sanity-check its numbers against what you can count with your own eyes elsewhere.

An Analytics dashboard — KPI numbers, bar and pie charts, all rearrangeable.

Automations

The “if this, then that” engine. Every automation is a Trigger (what happens) → Conditions (optional filters) → Actions (what to do). **Worth trying:** open one and read it; press **Test** to dry-run it safely; try “Start from a template” and “Build with a wizard.”

The Automations page — each flow has an on/off switch plus Edit, Test, and Logs.

Communication

Email and text campaigns to customer lists, with templates, surveys, and drip sequences. Demo people all have fake addresses and 555 numbers, so nothing can reach a real person. **Worth trying:** compose an email, add an audience, and notice the guardrails before anything sends.

Communication → Email — compose, pick an audience, and send (to fake addresses only here).

The modules themselves (Contacts, Reservations, and friends)

Click any module in the left sidebar for its records; click a record for its profile, timeline, and history.

Worth trying: [Create Dummy contact](#), edit a field and Save, then Search, Filters, sorting by a column, Manage columns, and the different views where offered — list, board, calendar, map.

Settings (behind the gear)

The deep controls, in tabs. Five are worth your time:

- **AI Receptionist** — the instructions the business teaches its receptionist, organized into sections, plus the voice picker. Edit something and Save.
- **Appearance** — themes! Pick one and confirm it sticks after a refresh. (Aero is the team favorite.)
- **Modules & Fields** — add a simple text field, confirm it appears on a record, then delete it.
- **Data Administration** — import/export, backups, and the Recycle Bin: delete a dummy contact, find it there, Restore it, and confirm the 30-day countdown shows.
- **Team & Permissions** — invite teammates and set their role.

Settings → AI Receptionist — the sectioned instructions the receptionist follows, and its voice.

8 · Your testing toolkit

Clarity gives you built-in tools to create test data and try features without a real phone or real customers. These are your best friends:

Tool	Where	What it does
Simulate call	Calls page	Runs a complete fake phone call from start to finish, creating a new call + contact. The fastest way to see the whole system work.
Create Dummy contact	Any contacts-style module	Instantly adds a realistic fake person so you have something to click on.
Demo Data seeder	Master Hub → Developer Tools → Tools	Wipes and refills a whole demo tenant with fresh fake data.
Test (on an automation)	Automations page	Safely dry-runs one automation and shows what each step would do — without really doing it.
Refresh	The circular arrow beside Search	Reloads the current data. Handy to confirm a change really saved.
Impersonate as...	Bottom of the sidebar	See the portal exactly as a specific customer user would — useful for checking what they can and can't see.

9 · How to test for bugs (the easy method)

You don't need a formal test plan or technical skills. The best auditors just use the product like a real person and stay alert. Here's a simple loop that works for any screen:

- Pick one screen (say, Contacts) and create some dummy data to work with.
- Do the obvious things a real user would do — open, edit, save, search, filter, delete, restore.
- After each action, ask: “did what I expected actually happen?” Refresh to be sure it saved.
- When something surprises you — anything at all — note it in Master Hub → Feedback.
- Move to the next screen and repeat.

TRY THE “UNHAPPY PATH” TOO

Bugs love edge cases. Leave a required box empty and hit Save. Put text where a number belongs. Click a button twice fast. Delete something and immediately restore it. Then refresh and reopen — did everything survive correctly?

TRUST YOUR CONFUSION

If something confused you — a new user — it will confuse a real customer. “This label was unclear” or “I couldn't find X” is genuinely useful feedback, not just crashes.

10 · What counts as worth reporting

If you see any of these, write it down:

- An error message, a blank screen, or a page that won't load.
- A change that doesn't save, or that disappears after you refresh.
- A number or count that doesn't match what you can see with your own eyes.
- A button or link that does nothing, or does the wrong thing.
- Layout that looks broken, overlapping, or cut off.
- Wording that's confusing, misspelled, or inconsistent.
- Anything that just feels off, even if you can't say exactly why.

REMINDER

When in doubt, report it anyway — a false alarm costs us nothing.

11 · How to report what you find

Report everything through **Feedback on the Master Hub** — the shared place where the whole review team (auditors, super-admins, and the owner) can see and reply to every ticket, so your findings never get lost.

USE THE MASTER HUB'S FEEDBACK — NOT A PORTAL'S

Each business portal has its own Feedback section meant for that business's staff. As an auditor, skip those: exit the portal first (← All tenants at the bottom of the sidebar), then open Feedback on the Hub.

Write what you did, what you expected, and what happened instead. Paste links to anything helpful. That's it — thank you for auditing Clarity!

Master Hub → Feedback — your reporting home base. The whole review team sees every ticket.
